

# Ragged wound with Derma Wax

It's not difficult to make a ragged 3D wound which looks like a real one. Here are instructions step by step to create a ragged wound on the face, limbs and body

## You need:

- Cleansing Lotion (or comparable)
- Derma Wax - Scar wax
- Derma Wax Spatula
- Cleansing Cream (or comparable)
- Make-up sponge
- Transparent powder
- Water Make-up or Crème Make-up - Face paints
- Make-up brush
- Fake blood

## How to use:

To obtain optimum adhesion, first clean the skin with Grimas Cleansing Lotion. Use the convex rounded side of the Derma Wax Spatula to take Derma Wax out of the jar. By scraping it out, you already make the texture a bit flexible. You then make the wax easier to model by applying it to the ball of your thumb and scraping it off again with the spatula two or three times. The wax must be flexible but also firm and must definitely not be allowed to get too soft and sticky.

## Modelling:

Apply Derma Wax to the skin with the convex rounded side of the spatula and smooth the edges down so that grease and moisture cannot get underneath.

Smooth the Derma Wax surface and edges off with the fingertip, using a little bit of Grimas Cleansing Cream.

Dab all over with a dry, clean make-up sponge. Doing this, you remove the excess Cleansing Cream and you create a skin-texture effect.

Powder the whole with a make-up sponge with Grimas Transparent Powder to matt and fix it; then turn the sponge over and continue dabbing with the clean side until the excess powder has been removed.

## Making a cut:

To create an "open wound", the Derma Wax construction has to be "cut open" with the sharp side of a Derma Wax spatula. Lubricate the tip of the spatula with a little bit of Cleansing Cream. This will allow the spatula to slide more easily through the Derma Wax, preventing it from sticking to the spatula. Create a triangular tear in the Derma Wax construction.

## Colouring:

To add a suggestion of depth to the 'wound', colour the bottom of the wound using black make-up. Then you colour the inner side of the wound with dark red make-up (Grimas Water Make-up or Crème Make-up).

## Finishing:

Finally, you add Grimas Blood or Filmblood, depending on the desired effect.

Grimas Blood has a light and syrupy texture and a deep red colour. Apply directly from the tube or with a brush.

Filmblood is available in two colours: light (A), oxygenated blood and dark (B), deoxygenated blood. You can apply it directly from the bottle.

## Removal:

Scrape the Derma Wax off the skin with the spatula. The blood can be removed from the skin with cold water initially and then with water and soap. You can clean the skin further if required with a cleansing milk or cleansing cream. Cleanse the skin afterwards with cleansing lotion.
